VoidZero Engineer — Cloudflare · Application for the Seoul location

Dear VoidZero team,

The most direct thing I can tell you is that I have already started doing this job. This month I began contributing to Vite+ and vite-task as [simulacre7](#), because the problems the team works on — toolchains that thousands of developers sit inside all day — are the ones I want to keep solving.

In vite-plus, I traced why `vp env use` behind the global `-C <dir>` flag never reached the current shell session, fixed it on the Rust side across POSIX sh/zsh, fish, Nushell, and PowerShell, and pinned the generated integration templates with snapshot tests — merged as [#2508](#) after two review rounds that also hardened the scripts against `set -u/NO_UNSET` and fixed a PowerShell type-safety edge. In vite-task, my PR [#693](#) (in review) extends the untrackedEnv contract to tracked bulk env queries, fixing cache-enabled builds that missed on every GitHub Actions run because per-run variables leaked into cache validation. Along the way I filed a root-cause analysis of npm lifecycle env not reaching package.json scripts ([#692](#)) and reviewed adjacent PRs ([#2385](#), [#2483](#)), verifying every finding against the sources before commenting. Digging into ambiguous, cross-repo issues and writing them up clearly is the part of this work I enjoy most.

Behind that is seven years of engineering where the through-line has been making complex systems legible to the people using them. At RIDI I decoupled operational UI changes from deploy cycles with server-driven UI and optimized large-list rendering on a major content platform; at Levvels I build AI-native products; at TmaxEnterprise I turned AutoML and explainable-AI systems into interfaces non-experts could act on, on top of an M.S. in HCI and Visual Analytics. My Rust experience extends beyond vite-plus: in the open-source MMORPG OpenMMO I have ten merged PRs reaching from the TypeScript client into the Rust server — cache eviction, account bans, trade validation — each landed through written design proposals and review.

I am based in South Korea, so Seoul is a natural fit, and asynchronous, written collaboration across time zones is how I have been working with the VoidZero maintainers already. I would love to make it my job.

Sincerely,

Kihwan Kim
